CS 290 Project Proposal

Project Proposal

The aim for my project is to construct a fansite for the recently released (into beta) video game Valorant from Riot Games. A homepage giving a basic outline of the game will help to introduce individuals to the rules and flow of the game. The website will contain basic information regarding each of the characters within the game along with their abilities. Additionally, it will also provide basic information regarding the weapons included within the game. Finally, the website will also display each of the maps currently available to play on. A common navbar will be utilized to connect each of the pages together in an intuitive manner.

Homepage

Subpages:

Characters   Weapons   Maps

- The carousal on the homepage will cycle through eye-catching screenshots from the game to generate interest.
- To satisfy the scroll box requirement, maps can be selected via a scroll box with a thumbnail to select.
- There will be a form for interested users to subscribe to a newsletter regarding the game.
- An unordered list of tips will be available for each character.
- A button will be available to download map layout pictures for personal reference/modification.
- An official link will bring users to the official Valorant website
